## Quiz 4 <br> Chemical Engineering Thermodynamics <br> February 12, 2015

1) 

P4.2 Twenty molecules are contained in a piston + cylinder at low pressure. The piston moves such that the volume is expanded by a factor of 4 with no work produced of any kind. Compute $\Delta S / k$.
2) Answer part (a) in BTU/hr, $R=1.987 \mathrm{BTU} / \mathrm{lbmol}-\mathrm{R}$. $459.67^{\circ} \mathrm{R}=0^{\circ} \mathrm{F}$.

P4.7 A mixture of $1 \mathrm{CO}: 2 \mathrm{H}_{2}$ is adiabatically and continuously compressed from 5 atm and $100^{\circ} \mathrm{F}$ to 100 atm and $1100^{\circ} \mathrm{F}$. Hint: For this mixture, $C_{P}=x_{1} C_{P 1}+x_{2} C_{P 2}$.
(a) Estimate the work of compressing $1 \mathrm{ton} / \mathrm{h}$ of the gas. $\left(C_{P}=7 / 2 \mathrm{R}\right)$
(b) Determine the efficiency of the compressor.
3) $\mathrm{R}=8.314 \mathrm{~J} /\left(\right.$ mole $\left.^{\circ} \mathrm{K}\right)$
4.5 When a compressed gas storage tank fails, the resultant explosion occurs so rapidly that the gas cloud can be considered adiabatic and assumed to not mix appreciably with the surrounding atmosphere. Consider the failure of a $2.5-\mathrm{m}^{3}$ air storage tank initially at 15 bar. Atmospheric pressure is $1 \mathrm{bar}, C_{P}=7 R / 2$. Provide an estimate by assuming reversibility.
(a) Calculate the work done on the atmosphere. Does the reversibility approximation overestimate or under-estimate the actual work?
(b) A detonation of 1 kg of TNT releases about 4.5 MJ of work. Calculate the equivalent mass of TNT that performs the same work as in part (a).

## Answers Quiz 4 Chemical Engineering Thermodynamics <br> February 12, 2015

1) 

P4.2 Twenty molecules are contained in a piston + cylinder at low pressure. The piston moves such that the volume is expanded by a factor of 4 with no work produced of any kind. Compute $\Delta S / k$.
(P4.2) Initial (each $x$ represents 5 molecule)

| xxxx |  |
| :--- | :--- |
|  |  |
| Final |  |
| x | x |
| x | x |

Create a space with a three empty boxes for the initial state. The number of molecules is too small to use Stirling's approximation.
$\mathrm{pl}=20!/(20!0!0!0!)=1$
$\mathrm{p} 2=20!/(5!5!5!5!)=20^{*} 19^{*} 18^{*} 17^{*} 16^{*} 15^{*} 14^{*} 13^{*} 12^{*} 11^{*} 10^{*} 9^{*} 8^{*} 7 * 6 /\left(5 * 4^{*} 3^{*} 2\right)^{\wedge} 3=$
11732745024
$\Delta \mathrm{S} / \mathrm{k}=\ln (\mathrm{p} 2 / \mathrm{p} 1)=\ln (11732745024)=23.18$
Or you could say $\Delta \mathrm{S} / \mathrm{k}=\mathrm{N} \ln \left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)=20 \ln (4)=27.7$
Entropy is less for the first solution because you have confined each group of 5 to a box of $1 / 4$ the total size. When these are free to move between boxes they are more random increasing S by about 4 .
2) Answer part (a) in $\mathrm{BTU} / \mathrm{hr}, R=1.987 \mathrm{BTU} / \mathrm{lbmol}-\mathrm{R}$.

P4.7 A mixture of $1 \mathrm{CO}: 2 \mathrm{H}_{2}$ is adiabatically and continuously compressed from 5 atm and $100^{\circ} \mathrm{F}$ to 100 atm and $1100^{\circ} \mathrm{F}$. Hint: For this mixture, $C_{P}=x_{1} C_{P 1}+x_{2} C_{P 2}$.
(a) Estimate the work of compressing 1 ton/h of the gas. $\left(C_{P}=7 / 2 \mathrm{R}\right)$
(b) Determine the efficiency of the compressor.
(P4.7) (a) Steady-state flow, $\Delta \mathrm{H}=\mathrm{Ws}$

Start 1 mole basis:
$x_{1}=0.333, x_{2}=0.667$, adiabatic, $C p=x_{1} C p_{1}+x_{2} C p_{2}, \mathrm{Cp}$ for each is the same anyway.
$M W=x_{1} M W_{1}+x_{2} M W_{2}=0.333(12+16)+0.667 * 2=10.66(\mathrm{~g} / \mathrm{mole})$
$R=1.987 \mathrm{BTU} / \mathrm{lbmol}-\mathrm{R}$.
$\Delta H=W_{S}=\int_{T_{1}}^{T_{2}} C p d T=\frac{7}{2} * R *(1100-100)^{\circ} R$
$\Rightarrow \Delta H=6954.5 B T U / \mathrm{lbmol}$
\& $\dot{m}=1$ ton $/ h=2000 \mathrm{lb} / \mathrm{h}$.
$\& M W=10.66 \mathrm{lb} / \mathrm{lbmol}$
$\Rightarrow \Delta H=\frac{2000 \mathrm{lb}}{h} * \frac{\mathrm{lbmol}}{10.66 \mathrm{lb}} * \frac{6954.5 \mathrm{BTU}}{\mathrm{lbmol}}$
$\Rightarrow \Delta H=W_{S}=1,305,000=1.3 * 10^{6} B T U / h$
(b) $\eta=$ ?? of the compressor.

To find the efficiency of the compressor, $\Rightarrow \mathrm{S}_{1}=\mathrm{S}_{2}$
But the enthalpy and the internal energy will change which gives a change in the

$$
\begin{aligned}
& \text { Work. } \Rightarrow \eta=\frac{W_{S}^{\prime}}{W_{S}}=? ? \\
& \Delta S=0=C p \ln \frac{T_{2}^{\prime}}{T_{1}}-R \ln \frac{P_{2}}{P_{1}} \\
& \Rightarrow C p \ln \frac{T_{2}^{\prime}}{T_{1}}=R \ln \frac{P_{2}}{P_{1}} \\
& \Rightarrow\left(\frac{T_{2}^{\prime}}{T_{1}}\right)^{C_{p}}=\left(\frac{P_{2}}{P_{1}}\right)^{R} \\
& \Rightarrow T_{2}^{\prime}=\left(\frac{P_{2}}{P_{1}}\right)^{\frac{R}{C_{p}}} * T_{1} \\
& \Rightarrow T_{2}^{\prime}=\left(\frac{100}{5}\right)^{\frac{2}{7}} * 559 R \\
& T_{2}^{\prime}=1315 R \\
& \& \Delta H^{\prime}=C p\left(T_{2}^{\prime}-T_{1}\right)=6.95(1315-559) \Rightarrow \eta=\frac{\Delta H^{\prime}}{\Delta H}=\frac{5258}{6955}=0.76 \\
& \Rightarrow \Delta H^{\prime}=5258 B T U / l b m o l
\end{aligned}
$$

3) $\mathrm{R}=8.314 \mathrm{~J} /\left(\right.$ mole $\left.^{\circ} \mathrm{K}\right)$
4.5 When a compressed gas storage tank fails, the resultant explosion occurs so rapidly that the gas cloud can be considered adiabatic and assumed to not mix appreciably with the surrounding atmosphere. Consider the failure of a $2.5 \mathrm{~m}^{3}$ air storage tank initially at 15 bar. Atmospheric pressure is $1 \mathrm{bar}, C_{P}=7 R / 2$. Provide an estimate by assuming reversibility.
(a) Calculate the work done on the atmosphere. Does the reversibility approximation overestimate or under-estimate the actual work?
(b) A detonation of 1 kg of TNT releases about 4.5 MJ of work. Calculate the equivalent mass of TNT that performs the same work as in part (a).
(4.05) When a compressed gas storage tank fails, the resulting explosion...
a) $n \Delta U=n C v\left(T^{r}-T^{\prime}\right)=W_{E C}$
n and the initial temperature are not given, but P and $\underline{\mathrm{V}}$ are given.
$\mathrm{PV} / \mathrm{R}=\mathrm{nT}$ and $\mathrm{V}^{\mathrm{f}}=\mathrm{V}^{1}\left(\mathrm{P}^{1} / \mathrm{P}^{\mathrm{f}}\right)^{\mathrm{CV} / \mathrm{Cp}}$, since the system is considered closed (no mixing with surrounding air, $\underline{V}^{\mathrm{f}}=\underline{\mathrm{V}}^{\mathrm{d}}\left(\mathrm{P}^{\mathrm{i}} / \mathrm{P}^{\mathrm{f}}\right)^{\mathrm{Cv/C}}$.
$\underline{\mathrm{V}}^{\mathrm{f}}=2.5(15 / 1)^{5 / 7}=17.3 \mathrm{~m}^{3},(\mathrm{nT})^{\mathrm{f}}=0.1 \mathrm{MPa}\left(17.3 \mathrm{E} 6 \mathrm{~cm}^{3}\right) / 8.314=2.081 \mathrm{E} 5 \mathrm{molK}$ $(\mathrm{nT})^{i}=1.5 \mathrm{MPa}\left(2.5 \mathrm{E} 6 \mathrm{~cm}^{3}\right) / 8.314=4.510 \mathrm{E} 5 \mathrm{molK}$
$\mathrm{n} \Delta \mathrm{U}=5 * 8.314 / 2 *(2.081 \mathrm{E} 5-4.510 \mathrm{E} 5)=-5.049 \mathrm{E} 6 \mathrm{~J}-\underline{W_{\text {r }}}$
b) $5.049 \mathrm{E} 6 \mathrm{~J} /(4.5 \mathrm{E} 6 \mathrm{~J} /[\mathrm{kg}$ TNT $])=1.12 \mathrm{~kg}$ TNT
