Chemical Engineering Thermodynamics Quiz 1 January 14, 2016

1)

P1.1. Estimate the average speed (mph) of hydrogen molecules at 200 K and 3 bars.

H₂ is 2.02 g/mole R = 8.314 J/(K mole)Joule = kg m²/s² 2.24 mph/(m/s) You can assume you know the temperature and pressure to 10% accuracy or you can make some other assumption concerning the accuracy of these values (state your assumption).

2)

1.12. The gas phase reaction $A \rightarrow 2R$ is conducted in a 0.1 m³ spherical tank. The initial temperature and pressure in the tank are 0.05 MPa and 400 K. After species A is 50% reacted, the temperature has fallen to 350 K. What is the pressure in the vessel?

 $R = 8.314 \text{ cm}^3 \text{ MPa/(K mole)}$

3)

1.17. Determine the temperature, volume, and quality for one kg water under the following conditions:

a. U = 3000 kJ/kg, P = 0.3 MPa
 c. U = 2500 kJ/kg, P = 0.3 MPa
 below

See tables below.

E.9. Properties of Water¹

I. Saturation Temperature

ANSWERS: Chemical Engineering Thermodynamics Quiz 1 January 14, 2016

1)

P1.1. Estimate the average speed (mph) of hydrogen molecules at 200 K and 3 bars.

H₂ is 2.02 g/mole R = 8.314 J/(K mole)Joule = kg m²/s² 2.24 mph/(m/s) You can assume you know the temperature and pressure to 10% accuracy or you can make some other assumption concerning the accuracy of these values (state your assumption).

Energy = $3/2 \text{ kT} = \frac{1}{2} \text{ mv}^2$

So $v \sim (3RT/M_w)^{1/2} = 3500 \text{ mph}$ if you assume 10% accuracy in the temperature and you assume an ideal gas. The ideal gas assumption is probably not very good at 3 bar. You don't need the pressure if you assume an ideal gas. The book answer seems to be wrong.

2)

1.12. The gas phase reaction $A \rightarrow 2R$ is conducted in a 0.1 m³ spherical tank. The initial temperature and pressure in the tank are 0.05 MPa and 400 K. After species A is 50% reacted, the temperature has fallen to 350 K. What is the pressure in the vessel?

 $R = 8.314 \text{ cm}^3 \text{ MPa/(K mole)}$

Initially assume you are at pure "A" Use the ideal gas law you can get the initial moles of "A" $n_{A,i} = PV/RT = 0.05 \text{ MPa } 0.1 \text{ x } 10^6 \text{ cm}^3/(8.314 \text{ (cm}^3 \text{ MPa/(K mole))} 400\text{K})$ =1.5 moles of A initially

Then 50% reacts so you have 0.75 moles of A and 1.50 moles of R so you have 2.25 moles total. Again assume an ideal gas (doesn't matter the type of atom for an ideal gas) $P = n_{total}RT/V = 2.25$ moles 8.314 (cm³ MPa/(K mole)) 400K/0.1 x 10⁶ cm³ = **0.075 MPa** assuming 10% accuracy in the initial values. He gets 0.065 in the book answer after a bit more complicated calculation.

3)

1.17. Determine the temperature, volume, and quality for one kg water under the following conditions:

a. U = 3000 kJ/kg, P = 0.3 MPa
 c. U = 2500 kJ/kg, P = 0.3 MPa

 (1.17) Determine the temperature, volume, and quality under the following conditions:
 a) U=3000, P=0.3 => superheated <u>q = 1, T = 400 + (3000-2966)/(3047.5-2966.0) * 50 = 421°C</u> V = 1.0315 + 21/50 * (1.1092-1.0315) = 1.064 m³/kg

Assume 10% accuracy in the P and U values so you have 1.1 m³/kg (you can make other assumptions concerning the accuracy but need to state that.) It asks for one kg of water so the answer is **1.1** m³ and 420°C.

c) U=2500,P=0.3 => two-phase, $T = 133.58^{\circ}C$ U = 2500 = 561. + q*1982.0, q = 0.978 $V = 0.001073 + 0.978 * (0.6058 - 0.001073) = 0.593 \text{ m}^3/\text{kg}$

Again, assume 10% accuracy in values he specifies for U and P so, $T = 130^{\circ}C$, q = 0.98, and it is for 1 kg so 0.59 m³.
