

## Quiz 2 November 8, 2010 Properties of Materials

The following micrograph shows the structure of a metal alloy.

- Sketch a simple phase diagram that could explain this grain structure.
- Pick a temperature in the phase diagram and give the composition of the two phases as well as the relative amount of the two phases present in the micrograph.
- What is coke and why is it used in the production of steel rather than using coal?
- For a liquid that phase separates into two liquid phases on cooling write an expression for the Gibbs free energy of mixing as a function of temperature and composition.
- How can a cloud point curve (UCST phase diagram) be obtained from the expression in part d?

a)

at  $T_A$  &  $\phi_E$  the lamellar structure can form.

b) The lamellar structure will be of composition  $\phi_A$  &  $\phi_B$  in the phase diagram. The amount of  $\phi_A$  is  $\frac{\phi_B - \phi_E}{\phi_B - \phi_A}$  and the amount of  $\phi_B$  is  $\frac{\phi_E - \phi_A}{\phi_B - \phi_A}$ .

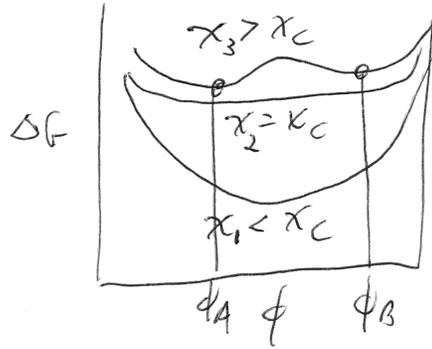

c) coke is coal heated with no  $O_2$  to remove oxides & impurities. It is used in steel production to reduce  $Fe_2O_3$  + because it is in a pure form of Carbon so fewer impurities.

d)

$$\frac{\Delta G}{NKT} = \phi \ln \phi + (1-\phi) \ln(1-\phi) + \phi(1-\phi)\chi$$

$$\chi = \frac{z \Delta \epsilon}{KT} \sim \frac{1}{T}$$

e) vary  $x$  in eqn (d)

for  $x_3 \sim \frac{1}{T_3}$
